HTML Subjective Questions & Answers

Quick revision notes • Beginner HTML • Based on our practice session

How to use this PDF

Revise the answers, then cover them and try explaining each concept in your own words. For code-based answers, focus on understanding what each tag does rather than memorising blindly.

1. What is HTML? Is it a programming language? Explain.

Answer: HTML stands for **HyperText Markup Language**. It is a markup language used to structure content on a webpage. It is not considered a programming language because it does not provide general-purpose programming logic such as loops and conditions by itself.

2. What is an HTML tag, an element, and an attribute?

Answer: An **HTML tag** is markup written inside angle brackets, such as . An **HTML element** usually includes the opening tag, content, and closing tag. An **attribute** gives extra information about an element and is written in the opening tag, for example `<a href="https://example.com">`.

3. What is the purpose of the <head> and <body> sections?

Answer: The `<head>` contains page information and resources, such as the title, metadata, and linked stylesheets. The `<body>` contains the webpage content displayed to users, such as headings, paragraphs, images, and links.

4. What is the difference between block-level and inline elements?

Answer: By default, a **block-level element** starts on a new line and generally takes up the available width. An **inline element** flows within the surrounding text and takes up only the space it needs. For example, is block-level and `<strong>` is inline by default. CSS can change an element's display behaviour.

5. What is the difference between and ?

Answer: `<strong>` indicates strong importance, seriousness, or urgency and is usually displayed in bold. `<em>` indicates stress emphasis and is usually displayed in italics. Their meaning is semantic, not just visual.

6. What is the difference between <ol> and ?

Answer: `<ol>` creates an ordered list, where item order matters (usually numbered). `<ul>` creates an unordered list, where items are usually shown with bullets. Both use `<li>` for each list item.

7. Why do we use comments in HTML? What is the syntax?

Answer: Comments help developers explain or organise code. Browsers do not display comments as page content, but comments can be seen in the page source, so do not put passwords or secrets in them. Syntax: `<!-- This is a comment -->`.

8. What is the difference between an HTML tag and an HTML element?

Answer: A tag is the markup itself, such as or . An element is the complete structure formed by the opening tag, content, and closing tag. For example, in `<p>Hello</p>`, the tags are and , while the paragraph element includes both tags and the text “Hello”.

Quick Recall

• **HTML** = structure/content; **CSS** = presentation/style; **JavaScript** = behaviour/interaction.

• **Tag** = markup in angle brackets; **element** = tags plus content; **attribute** = extra information in an opening tag.

• **<head>** = metadata/resources; **<body>** = visible page content.

• **<p>** = block by default; **** and **** = inline by default.

• **<ol>** = ordered list; **<ul>** = unordered list; **<li>** = list item.

• **Comment** = `<!-- ... -->`; not shown on the page, but visible in source.

Mini self-test

1. Is HTML a programming language? Why or why not?

2. In `<a href="page.html">About</a>`, identify the tag, element, and attribute.

3. Which section contains the page title and metadata?

4. Give one block element and one inline element.

5. When should you use `<strong>` rather than only bold styling?

6. Which list tag should you use when sequence matters?

7. Can HTML comments safely store passwords?

Revision tip: Try answering the mini self-test from memory. Then check the answers above and revisit any concept you could not explain clearly.
